

The RadioPass Plan

Every paid FRCR resource on the market sells **question volume**. RadioPass is the only one that can sell **understanding you can touch** — so give away the best interactive physics teaching in the world for free, become the thing every candidate has already seen before they consider paying, and monetise the exam deadline rather than the month.

What the market actually looks like

Verified, not assumed. Roughly **2,300–2,500 candidates a year**, about 4,500 module entries, growing ~15% annually. **81–83% are international** — the June and September sittings almost purely so. The UK produces only 400–475 candidates a year.

Physics is the wound. Global pass rates: 39.4% overall in September 2024, 48.1% in September 2025, and 60.4% globally in March 2025 against 89.2% for UK trainees. Half the international cohort fails the module the simulations were built for. A resit costs £399 in the UK and up to £1,134 in India, so anything RadioPass charges is a rounding error against failure.

COMPETITOR	PRICE	WHAT THEY SELL
Radiology Cafe	Free notes · £44.95 book	The default free resource. Owns FRCR search traffic.
FRCRbank	£39–£79	Question volume, refund-if-fail.
The Radiology Academy	£135 / 6 months	5,400+ questions, free-resit promise. Nearest comparator.
Revise Radiology	£397–£477 + VAT	70+ hours of lectures. The premium outlier.

Not one of them sells interactive simulation. The 2025–26 AI wave bolted chatbots onto MCQs. Nobody built a lab.

The honest product read

Only two assets are genuinely defensible: **the interactive simulation library**, and **the pipeline that produces it**. Everything else — the fact bank, the Pass Pledge, regional pricing, good UX, 453 questions — is copyable inside a quarter. A funded competitor could build one credible lab in 6–9 months; the full library plus taste plus a radiologist founder is an 18–24 month rebuild they would have to want badly. So: **be “the interactive one” in every WhatsApp group before Revise Radiology finishes a hiring round.** That is the whole race.

TWO THINGS TO STOP DOING

Do not lead marketing with “visual learning” — every competitor claims it and it is unfalsifiable. **Interactive** is falsifiable; own that word. And never lead with question counts: you have 453 against claims of 2,750–7,000. You lose that fight, and it is the wrong axis.

Positioning

“RadioPass turns FRCR Part 1 physics and anatomy into interactive simulations and PACS-style images you can actually manipulate — so concepts become obvious instead of memorised.”

Five words: **See the physics. Pass.**

The line that matters most — what one trainee says to another: “*You know RadioPass? It’s the one where you actually play with the physics — you change the pitch and watch what the scanner does.*”

The money

PLAN	PRICE	WHY IT EXISTS
Monthly	£25	The anchor. Built to make £79 look obviously right, not to be bought.
First FRCR Pass	£79	The hero — access until the day after your exam, minimum four months.
12-month	£129	Resitters and the organised.
Institutional	£1,250/yr	15 seats per training scheme. Anchor on $£129 \times 15 = £1,935$.

Regional bands, automatic at checkout: **A £79 · B £55 · C £39**. Never called a discount — “regional access pricing”.

The exam-cohort pass beats a monthly subscription because it matches how candidates think. Nobody wants a subscription; they want to pass in March. It kills cancellation guilt, and it prices against an outcome rather than a month.

The launch offer — Founding 300

The first 300 members get the Pass at **£49** — the launch list price during that window, never a discount off £79 — locked for life on renewal, a named place on the founders’ wall, and a standing invitation to the monthly feedback call. It closes at 300 members or at the March 2027 booking close (expected Friday 8 January 2027), whichever comes first. **Both limits are real, which is the only reason either may be used.** At member 301 the price becomes £79 and never returns.

The free tier — the most important decision here

The entire Ultrasound Physics Lab, Exam Lab included, around twenty modules, public, no signup, never gated.

This feels like too much. It is not. Everyone gives away questions — FRCR Focus gives 50, FRCRbank gives a mock. Only RadioPass can give away *simulations*. A signup wall in front of the best asset makes you look like another question bank; an open lab makes them look like paper.

THE JOB OF THE FREE TIER

To make a candidate think: *if this is what they give away, what is behind the login?* “Free forever” then becomes published copy and is unretractable. Registration buys the daily question, MRI foundations, the thorax anatomy region, 50 questions, the planner and one mini-mock with a percentile. Everything else is paid.

The launch

The website going live is not an event. **The RadioPass National Mock** is.

A free, timed, online physics mock with an instant percentile scorecard built to be screenshotted. Run twice: **Baseline, Sunday 15 November 2026, 19:00** — 20 stems in 60 minutes, “find out where you stand before revision starts” — then **The Final Mock, Sunday 7 February 2027**, the full 40 stems in 120 minutes, five weeks out at peak panic. The escalation is the reason to come back. Crash-course the following night at 20:00; **the Founding 300 offer is made at the end of it, once, to a warmed room.**

People accept an invitation to a free national mock. Nobody accepts an invitation to a product launch.

The channels

RANK	CHANNEL	WHY
First	Instagram Reels	Crossposted same-day to TikTok and Shorts. Radiology is image-first; the sims are natively scroll-stopping.
Second	YouTube long-form	An open goal — no dominant FRCR-physics channel exists, and long-form still earns search traffic in 2029.
Third	Scheme Reps	UK trainees live in WhatsApp groups you cannot post into, but they can.
Fourth	r/doctorsUK	79,000 members, +36%/yr. Four founder posts a year maximum, earned by six weeks of commenting first.

Telegram is how you reach the international 80% — the FRCR Part 1 Supergroup has 12,799 members and the Radiological Anatomy channel 16,375. Go through admins, never around them. Everything else — LinkedIn, Facebook, podcasts, paid — is ignored until month 13.

The growth path

Zero to 100 · August–October

Ten from your own scheme in exchange for recorded feedback calls. Forty from one honest r/doctorsUK post the week of 21 September, written as a trainee sharing a tool, with the free lab as the gift. Fifty from Reels starting 1 September and a Radiology Cafe listing.

100 to 1,000 · October–February

The mock does the work: 510 registered by 31 October, 800 registrations and 500 completions on mock night, 100 Founding sales within a fortnight. The Final Mock closes the gap to 1,000.

1,000 to 10,000

Arithmetic settles it — the UK has 400–475 candidates a year, so **international is not expansion, it is the only road**. Regional pricing live, mock events timed to the June and September 2027 sittings, distribution through Telegram, YouTube compounding in search. The scorecard is the engine: a percentile card is a status object a doctor shares without being asked, and it travels natively into groups you cannot otherwise reach.

Word of mouth — Pass It On

Every member holds three guest passes; each gives a colleague 30 days of everything. The reciprocal stays deliberately quiet — your access extends 30 days, or banks to your next sitting if your exam has passed. No cash, no commission, ever: **a doctor whose recommendation looks paid is worth nothing.**

The numbers

Budget ladder: **£500/month** November–January; **£2,000/month** from February 2027, gated on £8,000 banked and 500 mock completions; £5,000 only after paid CAC holds under £35 for two consecutive months.

	CONSERVATIVE	BASE	BREAKOUT
Registered users, month 12	1,800	3,200	6,500
Paying users, year one	180	350	900
Year-one revenue	£11,000	£24,000	£62,000

THREE CAC NUMBERS, NEVER MERGED

Year-one marketing cash is £19,500, so blended CAC is about **£56** — stated plainly rather than dressed down. Year one is *deliberately* acquisition-inefficient because the priority order puts reputation and word-of-mouth above revenue. **≤£20 is the steady-state target from month twelve. £35 is the paid-channel kill criterion.** Three different measurements.

The twenty decisions, ranked

- 01 Give away the entire Ultrasound Physics Lab, permanently, no signup.
- 02 Sell the **£79 First FRCR Pass**, not a monthly subscription.
- 03 Make the launch a **free national mock**, not a website going live.
- 04 Physics first. Always physics first — it is the module that fails people.
- 05 Put a touchable simulation on the homepage above the fold, zero signup.
- 06 Founding 300 at £49, genuinely capped, genuinely deadline-bound.
- 07 Own the word *interactive*. Abandon “visual”.
- 08 Instagram Reels from 1 September; YouTube long-form fortnightly.
- 09 Six weeks of r/doctorsUK comments before the first post. Four posts a year, maximum.
- 10 Recruit Scheme Reps — 15 by 31 October, 50 by end of February.
- 11 Sponsor the Society of Radiologists in Training. Buy legitimacy, not reach.
- 12 Get listed on Radiology Cafe. Never compete with them on notes.
- 13 Go through Telegram admins, not around them.
- 14 Regional pricing live at launch — the market is 80% international.
- 15 Pass It On: three guest passes, 30 days each, no cash.
- 16 Instrument everything on day one, or every number you have is a feeling.
- 17 Not one pound of paid advertising before February 2027.
- 18 Grow the question bank quietly to ~1,000. Never market the number.
- 19 Keep the clinical job — it is the credibility, and it removes desperation.
- 20 Sell to training schemes from January: £1,250 a scheme, three signed in year one.

What could make it explode

The scorecard becoming a status object in Telegram and WhatsApp groups you will never see. A single YouTube physics video that becomes the canonical explanation and compounds for years. And outcome evidence — once you can honestly say what proportion of your engaged users passed, nobody in this market has an answer to that.

What would kill it

Beautiful but insufficiently useful — candidates admire the labs, revise from a question bank, and never pay. Founder burnout, signalled by the Saturday content block being skipped twice running. Or a slow leak of credibility from one overclaimed statistic, in a market of a few thousand doctors who all talk to each other.

If RadioPass were my company, this is exactly what I would do.

Figures in GBP. Exam data from the RCR pass-rates report 2021–2025 and RCR CR1 guidance; competitor pricing verified 7 August 2026. All 2027 RCR dates are labelled expected until the College publishes them. The full 43-section strategy — content calendar, 50 social formats, 20 YouTube videos, SEO taxonomy, email sequences, the 90-day plan and the day-by-day fortnight — is in RadioPass-Launch-Strategy.md.
